

# Hypertension Management

## Demo Practice

23 April 2025 09:52

Which patients are included in this report?

What data is in this report?

How do we use this report?

What are ACG patient complexity levels?

### Which patients are included in this report?

- Patients aged 30-89yrs with a coded diagnosis of Hypertension that is marked as active.
- Patients with existing CVD are excluded.

### What data is in this report?

- Age of patients.
- Selected missing pathology tests for monitoring side effects of hypertension and CVD risk.
- Medication missing is where there hasn't been a prescriptions for lipid lowering, or antihypertensive medications in the past 18 months.
- Patients without a blood pressure (SBP), ACR, MALB or protein urea test in the past 12 months.
- "Last Visit" displays the last visit that was billed (excludes administration and normal after care entries in patient record).
- "Existing appt" will display the next booked appointment.
- The data are up-to-date with the time stamp on this report.

### How do we use this report?

- No lipids in last 12 months.
- The 'Search' function can help you find specific content
- The "Existing appt" column displays patient appointments that have been booked for dates beyond the report
- The 'Last Visit' column displays the date the patient last had an appointment at the practice
- The 'Remove' column provides the option to selectively remove individual patients from this type of report for the next twelve months.
- The report can be exported as an Excel or CVS file by clicking the 'Export To Excel' or 'Export to CSV' tabs
- All reports that are generated are automatically saved to a folder on your practice computer.
- The report can be printed by clicking the right mouse button while hovering the cursor over the report and selecting the 'print' option.

### What are ACG patient complexity levels?

- There are five complexity levels, ranging from 1 to 5. For data analysis purposes, there is a sixth level, level 0. Level 0 is for those patients with no recorded diagnoses or significantly incomplete or missing data
- Level 1 indicates a very low level of complexity with no known risks for poor health outcomes, while level 5 is the highest complexity. Patients with level 5 complexity typically have significant multi-morbidity and polypharmacy and are at greatest risk of poor health outcomes.
- Level 5: High complexity, characterized by instability, multimorbidity, polypharmacy or patients requiring end-of-life care
- Level 4: High to moderate complexity, characterized by multimorbidity
- Level 3: Moderate complexity. Patients typically have at least 1 chronic condition and are at risk of progressive deterioration.
- Level 2: Low to moderate complexity. Patients typically have one risk factor
- Level 1: Low complexity. Patients are generally healthy and only present because of acute, time-limited conditions or minor issues.
- Level 0: no or only invalid diagnosis
- Patients with higher levels of complexity are more likely to be hospitalized than those with lower levels. However, complexity is not directly related to the risk of being hospitalized. Many Primary Sense reports therefore includes both estimates.
- If the complexity of a patient is calculated from results that are more than 12 months old, the level will be displayed in brackets, e.g. (3), rather than 3.
- If there is insufficient information to calculate a complexity level, the result will be displayed as 'N/A'
- The complexity levels of patients in this report were calculated with the Johns Hopkins ACG tool. The ACG is underpinned by a robust evidence base of >30 years of practical application. The tool is used in 20 countries and has been validated in different healthcare settings, including general practice.

# Report Synopsis

Patients with Hypertension diagnoses in the practice across 30 day intervals intervals

All Doctors ▼  
 View As Columns ▼

**Report-Related Data:**

Patients Missing Interventions: 5

Note: Empty interval columns will populate over time.

## Patients with coded diagnoses

[Information about this table](#)

Patients without a blood pressure, ACR, MALB or protein urea test in the past 12 months. Patients with a prescription for an anti-hypertensive or lipid lowering medication in the past 18 months, Y means its missing or not recorded
